报告题目	<p><b>Complexes of large alkaline-earths and related divalent metals: Synthetic aspects, catalysis and mechanistic investigations</b></p>
内容摘要	<p>Our group is involved in the development of original complexes of the large alkaline-earth metals (calcium, strontium and barium) and other related divalent elements (tin(II), lanthanide(II), zinc) for the homogenous catalysis of ring-opening polymerisation and hydroelementation reactions. New synthetic strategies for the stabilisation of highly reactive complexes will be presented today. Their performance as catalysts in the polymerisation of cyclic esters will then be detailed, with an emphasis on the understanding of the associated mechanisms and the introduction of new kinetic models for ROP reactions. The behaviour of these complexes and the mechanisms at work in the catalysed hydroelementation of alkenes will also be discussed.</p> <p>a) Y. Sarazin, B. Liu, T. Roisnel, L. Maron, J.-F.
